

# 420-DW2-AS – Web Client Development (client side)

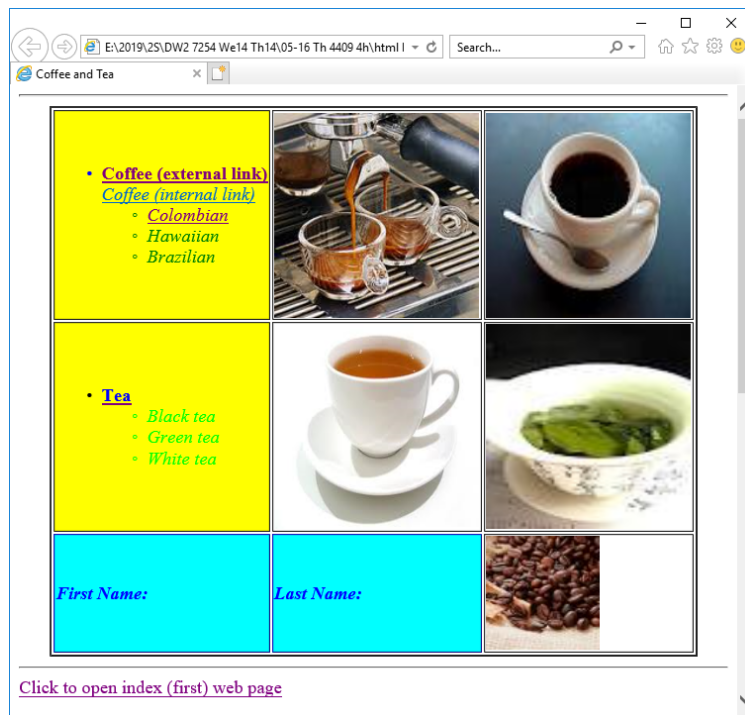

## Lab 1-4

Use the template XHTML to create the web pages, and the images to create the web site. Follow the same structure for the folders and sub-folders (index.html) like in the image bellow.

The link in the **index.html** web page will open the appropriate web page (Coffee & tea), but you have to modify the path to that file (**//page/CoffeeAndTea.html**). You have to modify all the links to the images, because all images are in **img** folder (use relative references).

Next you have to add some description for different type of tea and of coffee (use *definition list* - **dl**, **dt**, **dd** ), and internal links (use **id** and **#**) into the **page1.html** for lists items and images; in order to go back and forth between the menu (top section) and the description of different types (like in the example).

Compress and upload your web site by LEA of Omnivox  
Thank you
